

What are the steps that were taken to prepare a Wellhead Protection Plan?

1. A Community Planning team was formed.
2. The area to be protected was identified.
3. Land uses and possible sources of pollution in the wellhead protection area were identified.
4. Ways to prevent groundwater pollution were identified.
5. An alternate way to supply water was determined in the event that the system is interrupted.

What Can You Do?

To help implement the City's WHP plan:

- Serve on work groups
- Attend wellhead protection meetings
- Help identify land uses and possible sources of contamination on your property

To protect local groundwater:

- Recognize and manage possible sources of contamination on your property
- Use hazardous products as directed and dispose of them properly
- Conserve water

What is Groundwater?

Groundwater is the water that fills the small spaces between rock particles (sand, gravel, etc.) or cracks in solid rock. Rain, melting snow, or surface water becomes groundwater by seeping into the ground and filling these spaces. The top of the water-saturated zone is called the “*water table*.”

When water seeps in from the surface and reaches the water table, it begins moving towards points where it can escape, such as wells, rivers, or lakes.

An *aquifer* is any type of geologic material, such as sand or sandstone, which can supply water wells or springs.

The groundwater, which supplies wells, often comes from within a short distance (a few miles) of the well. How fast groundwater moves depends on how much the well is pumped and what type of rock particles or bedrock it is moving through.

Where Does Your
DRINKING WATER
Come From?

The
City of Montrose

Has developed a
WELLHEAD PROTECTION PLAN

In cooperation with
Minnesota Department of Health
&
Minnesota Rural Water Association
Source Water Protection Program

Montrose, MN 55363

A community effort to protect public wells...

The city of Montrose, MN relies on groundwater for their drinking water supply. The City has two primary wells. These wells draw water from a groundwater aquifer located several hundred feet underground. Groundwater aquifers are vulnerable to contamination from human land surface activities.

The city of Montrose will begin working with their citizens to protect drinking water supplies by developing and carrying out a Wellhead Protection plan. This plan has been prepared in conjunction with several local, county and state agencies. The Minnesota Department of Health is the lead agency for the State's program and assists communities with defining wellhead protection areas and developing plans to protect wells. The Minnesota Rural Water Association, in cooperation with the U.S. Environmental Protection Agency, provides technical assistance to public water suppliers to help meet the system's Wellhead Protection Goals.

For more wellhead protection information, contact the MN Rural Water Association at (800) 367-6792.

Most Minnesotans get drinking water from wells!

Wellhead Protection is a way to prevent drinking water from becoming polluted by managing possible sources of contamination in the area which supplies water to a public well. Wellhead Protection will be an ongoing need for communities in Minnesota who provide a public water supply. Everyone has an important part to play in protecting drinking water wells—today and for the future. Become involved in protecting the drinking water for your community. Contact one of the listed agencies for additional information, or call your community's water department.

How do wells become polluted?

Wells become polluted when substances that are harmful to human health get into the groundwater. Water from these wells can be dangerous to drink when the level of pollution rises above health standards. Many of our everyday activities can cause pollution. Much can be done to prevent pollution, such as wise use of land and chemicals. The expense of treating polluted water or drilling new wells can also be avoided. Help avoid drinking water contamination by being an environmentally aware citizen.
